## 1. Introduction

The digital music industry has undergone a dramatic transformation, with platforms like Spotify shaping how users consume and interact with music. In 2023, Spotify continued to dominate the streaming space, amassing extensive data on listener behavior, artist performance, genre trends, and global engagement. This report presents an interactive Power BI dashboard that visualizes and analyzes Spotify data from 2023 — offering insights into listening habits, top-performing tracks and artists, global music trends, and user engagement patterns. The goal is to provide a comprehensive view of how music was experienced in 2023, supporting deeper understanding and data-driven decisions for artists, marketers, and music lovers alike.

## 2. Objective

**The primary goal of this project is to:**

- Analyze Spotify user behavior and listening patterns from the year 2023.
- Explore trends in music genres, artist popularity, and track performance across various regions.
- Identify key insights related to top playlists, most active listening hours, and user engagement.
- Support data-driven decisions for artists, marketers, and product teams through clear visual storytelling and interactive analytics.

## 3. Methodology

**Tools Used:**

- Power BI for interactive data visualization, modeling, and dashboard creation.
- DAX (Data Analysis Expressions) for calculating KPIs, trends, and dynamic insights.
- Excel for initial data preprocessing and transformation.

**Data Sources:**

- Spotify's 2023 user activity dataset including track plays, skips, playlist data, and listening duration.
- Artist and track metadata such as genre, release date, and popularity scores.
- Region-wise streaming statistics and user engagement metrics from Spotify's public analytics and developer APIs.

## 4. Conclusion

In conclusion, the key metrics provided offer valuable insights into user engagement and activity within the Spotify platform. By tracking **Total Plays**, we can gauge the overall level of content consumption. The **Unique Users** metric allows us to understand the breadth of the user base, while **Average Session Length** gives an indication of how long users are interacting with the platform during each session. Lastly, **Plays Per User** helps evaluate user engagement on an individual level, providing a clearer picture of how frequently users are returning to listen to music. Together, these metrics form a comprehensive overview of the platform's usage, which can be leveraged to optimize user experience, content recommendations, and marketing strategies.
